Assignment name: CS 470 Final Reflection

<https://youtu.be/Uc0XIZ2RXeU>

This project helped me to gain a better and deeper understanding of the full stack development and motivated me to learn more and explore different opportunities that exist out there. I understand that we just scratched the surface, and there are a lot to learn, and it would not happen without practicing a learning every day.

The most interesting part was learning about Docker and its great and invaluable benefits and resources (images, online community, etc.) that it provides to build full stack applications in such an easy and quick way. Docker Compose and YAML files were also amazing tools that made containerization even easier.

Learning about AWS vast and unique services for cloud computing was another great experience that I wish I had learned sooner. The only downside was that I was not able to work with Roles and policies in this class due to the restrictions that our lab had, but I spend some time on it to learn more about creating roles and policies from scratch.

Cloud computing has been and will be the future of information technology, and I would like to learn more about other competitors in the field such as Microsoft Azure, Google Cloud Platform, IBM Cloud and many more, so that I can choose the best solution for each project and situation.
